

PHYS 308 Syllabus

Table of contents

1	Who is the professor?	2
2	Classroom expectations	2
2.1	What you can expect from me	2
2.2	What I expect from you	2
2.3	What is not expected	3
3	Technology Policy	3
3.1	Use of LLMs	3
3.2	Use of technology during class time	4
4	Class Recording Policy	5
5	Assignments and Grading	5
5.1	Practice	6
5.1.1	Reading Quizzes	6
5.1.2	Homeworks	6
5.2	Proficiency in the Learning Objectives	7
5.2.1	In-Class Assessments	7
5.3	Metacognition	8
5.3.1	SMART goals	8
5.3.2	Reading and Self-Reflection	8
5.4	Extra Credit	8
6	Deadlines and Late Policy	9

1 Who is the professor?

I'm Casey Berger and this is my third year at Bates College. At Bates, I've taught PHYS 211 (Newtonian Mechanics), PHYS 216 (Computational Physics), PHYS 301 (Mathematical Methods of Physics), PHYS 308 (Introductory Quantum Mechanics), and PHYS 409 (Quantum Theory). Before Bates, I was a professor at Smith College in Physics and Statistical and Data Sciences. And long before that – before I went to school for physics and computational science – I went to college for philosophy, film production, and Spanish and worked in the film industry. It took me a long time to find my way to physics, but I wouldn't change any of it. The long and winding path taught me so much more about who I am, what I am capable of, and how many opportunities are available in the world. It also taught me that it's never too late to find a new passion or change your career direction.

My research involves applying high performance computing and data science techniques to many-body quantum systems, which just means studying how medium-to-large numbers of quantum objects like electrons, neutrons, or atoms interact with each other and their environment. This sounds straightforward, but unfortunately the mathematics of quantum mechanics means these problems become impossible to solve by hand and extremely challenging to solve even with high powered computers when the system is still only a few particles.

Outside of physics, I am a person with lots of interests and hobbies. I love being outdoors in all seasons, but also love reading a book or playing board games inside with a cup of tea. Ask me for book recommendations, recipes for interesting food, or great hikes in Maine!

2 Classroom expectations

2.1 What you can expect from me

- I will stay home if I am feeling sick and make arrangements to deliver the course material
- I will work with you to arrange accommodations when you need them
- I will respect your time by starting and ending class on time
- I will answer your questions thoughtfully, and if I don't know the answer, I will follow up in a timely manner
- I will embrace who you are as whole people
- I will model respect, openness, and engagement, and foster a supportive and inclusive environment
- I will be honest when I make mistakes, because failure is part of growing

2.2 What I expect from you

- That you stay home if you are sick and contact me via email to arrange accommodations
- That you be mentally present when you are in class, to the best of your ability

- That you make a good faith effort at the work, both during and outside of class time
- That you ask questions if you are confused (you may do this privately – there is no obligation to ask during class hours)
- That you communicate with me when you have problems that interfere with your ability to engage with the coursework
- That you treat your peers with respect and openness, and that you participate in creating an inclusive, supportive, and engaged classroom

2.3 What is not expected

- Perfection. Ever. It’s a myth.
- That you will ‘sit still’ or ask for permission to leave the classroom to go to the bathroom or if you just need a minute. You’re adults and I trust you to do what you need to.
- That everyone will learn in the same way. You do not have to match some “model student” to do well in this class

3 Technology Policy

3.1 Use of LLMs

Large Language Models and agentic AI are so ubiquitous now that it seems almost silly to say so. You are facing the great challenge of how to navigate a world filled with AI-generated information and where the advice changes from minute to minute about whether you must become an AI expert or avoid AI to succeed.

But you are also a student at Bates College, where our mission includes educating “the whole person through creative and rigorous scholarship in a collaborative residential community” and “preparing leaders sustained by a love of learning and a commitment to responsible stewardship of the wider world.” And that means learning to cultivate your very human skills of creativity and critical thinking, and engaging in the productive struggle that leads to growth and learning. AI presents major challenges to all these values, from the environmental impacts of building and maintaining them and the traumatizing and exploitative nature of the labor involved in training them to the way cognitive offload reduces our capacity for independent thinking and the emotional offloading erodes our ability to live in community.

But it is up to you, as adults, to learn how you want to exist in the world we are creating right now. So while I will not fully ban the use of AI in this course, I will ask you to proceed very thoughtfully and carefully if you do use AI, and to follow these guidelines.

1. If you are going to use AI in any way in this class, you must **first** complete the [AI assignment in the metacognition grade category](#). This is part of your grade anyway, so it benefits you to do this.

2. If you use AI in any way, even just to ask a quick question and clarify something, you **must** cite your source. This means including a record of the prompt and the response, as well as one sentence discussing what you learned from this use of AI.
3. You may **never** submit something as your own work if it was done by AI, even if you hand-copied it. Just like you wouldn't claim your classmate's work as your own, you can't claim an LLM's work either.

Violation of this policy, along any of the three requirements, will result in a zero on the assignment in question.

3.2 Use of technology during class time

Technology is completely infused into our lives, and I'm not trying to convince anyone to stop using it. As a computational physicist, it's my literal vocation to use digital technology, and as a teacher, I spend many hours a day staring at my screen to write lesson plans and respond to emails. But it's important to know that as useful a tool as technology is, it can also inhibit us.

First, the science. While we all believe ourselves to be excellent multitaskers, studies show that we can't actually focus on more than one thing at a time - what we are doing is actually rapidly task switching between one task and the next, and that [task switching takes time and energy, making us do both tasks more poorly](#). This means that if you're toggling between your email, social media, text messages, or whatever other content might be up on your laptop, phone, or tablet in class, you are going to have a harder time learning the content in class *and* a harder time doing whatever else you are trying to do. In addition, studies have found that [merely being in the presence of our smartphones can cause us to be distracted by them](#).

I have found this to be true, and as a general rule, if I'm working on something that requires my focus, such as writing a lesson plan or working on research projects, I have a box in my office that I put my phone in so I can't be distracted by it.

Our goal in this class is to learn, and class time is an important time set aside for us to meet together in community to work towards the learning goals. In order to make sure you get the most out of that time, and to help support your classmates to not be distracted, the policy for devices is the following:

- Phones must be on silent and out of view (to you and your classmates) throughout the duration of class
- Laptops and tablets are *opt in* only, meaning if you wish to use one and do not already have accommodations to use one with the Office of Accessible Education, you must submit a request to use a specific device or devices in the [welcome form](#), along with an explanation of how each device will be conducive to your learning and how you will use it

Please note that there is a handy way to not only follow the course policy on cell phones, but also earn some [extra credit](#), so I encourage you to take advantage of that to not only help you practice the habit of putting your phone away when it's time to focus, but also get yourself a grade boost.

One final note: I recognize that sometimes we have situations that require us to be reachable, so if you have a special circumstance that means you need to be able to take a call when it comes in or receive an email notification, please talk to me about an exception to the policy.

4 Class Recording Policy

In line with our shared values around Academic Integrity and Conduct as articulated in the Student Code of Conduct, the Dean of Faculty office reminds all students that screen capturing or making audio/video recordings of synchronous or asynchronous meetings, lectures, discussions, course materials, or other classroom activities without the prior knowledge and consent of all parties is prohibited. This applies to the use of tape or digital recorders, cell phones, smartphones, computers, and other devices capable of creating a screen capture or making audio/video recordings. Likewise, the editing, sharing, or use of recorded or digitally shared course content outside of their assigned or intended purpose is also prohibited. Students with disabilities who wish to record classroom activity should contact the Office of Accessible Education for information about appropriate protocols.

5 Assignments and Grading

There are three main categories for grade items in this class:

1. [Practice](#): This work is low-stakes work intended to prepare you for the assessments in this class. It includes pre-class quizzes on the reading and the weekly homework problems. This will make up 45% of your final grade.
2. [Proficiency](#): 50% of your grade will be made up of 5 bundles of learning objectives. You will have opportunities to demonstrate your proficiency in these learning objectives through in-class tests.
3. [Metacognition](#): One of the most important skills you will learn in college is how to learn. This is called metacognition, and I have built into the grade in this class a chance to practice these metacognitive skills. 5% of your final grade will come from the metacognition assignments in this category.

Figure 1: Grading Scheme

5.1 Practice

Almost half of your grade will be made up of a collection of work I am calling “Practice.” This includes reading the textbook and completing a pre-class reading quiz as well as solving homework problems and reflecting on your work.

For every assignment in the Practice category, the late policy is the same. Work done before the due date will receive full credit. All work done after the due date will receive half credit.

This is the base of the learning pyramid, and so there is a lot of work in this category.

There will be 140 total points available in the Practice category, but the maximum grade you can achieve is 120 points. There are more points available than you need, so you can make some choices about what you want to put your energy into.

5.1.1 Reading Quizzes

These are simple quizzes based on the reading, intended mostly to strengthen your retention of what you read. These are due at 11AM the day of class, and there will be 20 reading quizzes throughout the semester.

The reason I have these due two hours before class, rather than immediately before class, is so that I have time to look over them and see what questions arise. This helps me tailor that day’s class toward what people actually need more support with.

5.1.2 Homeworks

Every week, there will be a number of homework problems assigned. When you complete a problem, you can submit it on Lyceum. Once you do that, the solution will become available.

You should check the solution against your own work and then fill out the reflection form for that problem in Lyceum.

You will only get credit for a problem if you both submit a good faith attempt at the solution and fill out the reflection form.

5.2 Proficiency in the Learning Objectives

There will be five topics with learning objectives that will be assessed in this class. Those can all be found on the [Course Content](#) page.

The topics are:

- The Math of QM
- Measurement
- Time Evolution
- The wave function
- Applications

You need to earn 8 learning objectives (not unique) in each topic, with the exception of “The Math of QM”, where you need to earn 16. This is for two reasons: the math will show up in every problem, so you will have many opportunities for that learning objective, and you need to not just show me that you can do this a few times, but it should be a skill you are able to apply consistently across the entire semester.

5.2.1 In-Class Assessments

There will be two midterms and a final, each of which will be graded on a single-point rubric. That rubric will have a list of the learning objectives assessed by the test, and you will be graded on whether you demonstrated proficiency in that learning objective.

Each midterm is technically cumulative, but it will emphasize more recent topics over older ones. There will be two versions of each midterm, so you will have two chances to demonstrate proficiency, and I will always take the higher of the two scores.

There will also be a cumulative final, which I will design to contain the most-missed learning objectives across the class.

5.3 Metacognition

You can earn a total of six points towards metacognition, but you only need three to complete this category. These assignments are designed to get you thinking about how you engage with your learning.

The due dates on these assignments are fixed in order to support the process of self-reflection and growth. If you want to do these, you must complete them by the deadline posted in Lyceum

5.3.1 SMART goals

This consists of three parts, each of which is worth one point.

- Reading about SMART goals and setting one for yourself
- Checking in with your progress mid-semester on your SMART goal (you must complete the first assignment to complete this one)
- Reflecting on how your SMART goal went at the end of the semester (you must complete the first assignment to complete this one)

5.3.2 Reading and Self-Reflection

There are two reflection assignments, both of which must be done early in the semester:

- Growth mindset: This is a short reading assignment on growth mindset versus fixed mindset, followed by a short reflection on when you have experienced a growth mindset before in your life. This is worth one point.
- AI reflection: this consists of a set of readings about generative AI, followed by a short reflection on what you learned from the readings. This is worth two points, as the readings are more substantive.

5.4 Extra Credit

Because there is already some extra room built into your grade, there will only be one opportunity to earn extra credit in this class, and that is by turning your phone on do not disturb and placing it in a designated place every class. If you do this for 75% of class sessions, I will round your grade up after the final grade is calculated.

6 Deadlines and Late Policy

There is so much flexibility in the number of points you can earn in this class, so there will be no extensions provided on homeworks, reading quizzes, or metacognition assignments except in case of major extenuating circumstances.
